

Ip address :

(128)

class	Starting Address	Ending Address	
A	0.0.0.0	127.255.255.255	Host Address
B	128.0.0.0	191.255.255.255	
C	192.0.0.0	223.255.255.255	
D	224.0.0.0	239.255.255.255	Multicast
E	240.0.0.0	255.255.255.255	Experimental purpose.

How the class were created →

192.168.32.170

Network ID Host ID

class A $\begin{matrix} 8 \text{ bits} & 8 \text{ bits} & 8 \text{ bits} & 8 \text{ bits} \\ \boxed{\text{Network}} & \boxed{\text{Host}} & \boxed{\text{Host}} & \boxed{\text{Host}} \end{matrix}$ / 8 or 255.0.0.0

class B $\begin{matrix} \boxed{\text{Network}} & \boxed{\text{Network}} & \boxed{\text{Host}} & \boxed{\text{Host}} \end{matrix}$ / 16 or 255.255.0.0

class C $\begin{matrix} \boxed{\text{Network}} & \boxed{\text{Network}} & \boxed{\text{Network}} & \boxed{\text{Host}} \end{matrix}$ / 24 or 255.255.255.0

1.2.3.4

↓
class A IP Address

101.200.100.1

class B IP address

192.168.1.1

class C IP address.

IP address are two type ~~32 64 16 8 16 8~~

Public vs Private IP address 2^8 2^8 2^8 2^8 2^8 2^8 2^8 2^8

Private	Public
LAN	Internet

Find the Number of Subnets and the number of Valid Hosts per subnet?

• Subnets
→ 2^1 # of host bits → 2

• valid Hosts

→ 2^1 # of host bits (-2) → network
→ Broadcast

192.168.1.0

255.255.255.240 / (28)

• class c network

• subnet = $2^4 = (16)$ → Number of subnet.

• Host = $2^4 - 2 = (14)$ → valid Host

How to Find All subnet Numbers

192.168.10.5/28 → CIDR → classless interdomain routing

① What is network address?

192.168.10.5 / 28

+10000000 . 10101000 . 00001010 .

network bit

0000 / 0101

subnet host
bit

Now!

Network address: All network bits + subnet bits as its, host bits all 0

11 000000 . 10101000 01000010 . 00001010 . 0000/0000
network bit sub net host bit

\therefore Network address = 192.168.10.0/28

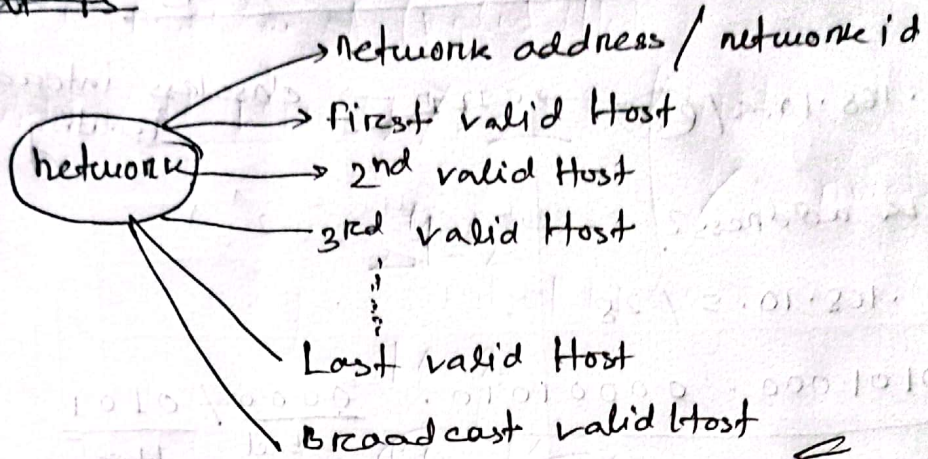

⑪) What is Broadcast address?

Broadcast address = All network bits \uparrow subnet bits \rightarrow 1
is, host bit all \downarrow

11000000.10101000,00001010. 0000 / 1111
Subnet Host

\therefore Broadcast address = 192.168.10.15

~~② What is~~

③ What is first valid Host? $192.168.10.5/28$

~~Network~~ Network address = 192.168.10.0 / 28

Broadcast address = 192.168.10.15/28

∴ fast valid Host = 192.168.10.1/28

Last valid host = 192.168.10.14/28

⑤ What is subnet mask? 192.168.10.5/28 2A

11000000 . 10101000 . 00001010 . 0000 / 01011

network bit subnet host

subnet mask = All network bits + subnet bits 1, host bit 0

[illegible]

$\therefore \text{Subnet mask} = \underline{255.255.255.240}$

⑥ What is Block size/ host per subnet?

$$\text{Subnet mask} = 255.255.255.255 \quad (255)$$

$$\text{Subnet mask} = 255.255.255.240$$

$$\text{Block size/ host per subnet} = 256 - 240 = 16$$

⑦ What is number of subnet?

$$\text{Subnet mask} = 255.255.255.240$$

1 1 1 1 1 1 1 . 1 1 1 1 1 1 1 . 1 1 1 1 1 1 .

network

$$\begin{array}{r|l} 1111 & 0000 \\ \hline \text{Subnet} & \text{Host} \end{array}$$

$$\therefore \text{Number of subnet} = 2^x$$

$$= 2^4$$

$$= 16$$

x = number of 1 in subnet bit

$$= 4 \quad x = 4$$

✓ 1st subnet = 192.168.10.0 to 192.168.10.15

2nd subnet = 192.168.10.16 to 192.168.10.31

3rd subnet = 192.168.10.32 to 192.168.10.47

⋮
192 to 192.168.10.256

⑤ What is number of valid Hos?

$$\text{Number of host} = 2^y - 2$$

$$= 2^4 - 2$$

$$= 16 - 2$$

$$= 14 \quad \checkmark$$

when

$y = \text{number of 0 in}$

TCP/IP protocol suite

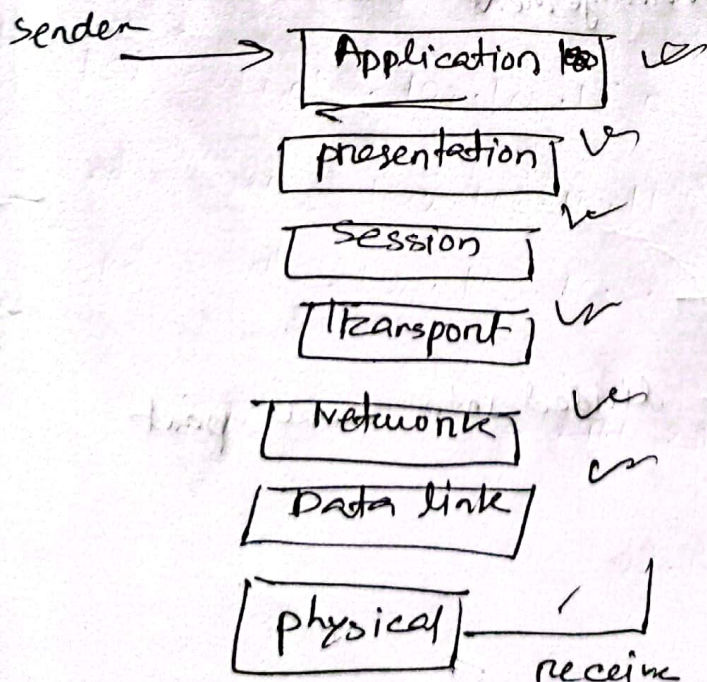

Tanbam baks

5 layer	OSI (7 layer)	4 layer
Application layer	Application layer	Application layer
	Presentation layer	
	session layer	
Transport layer	Transport layer	Transport layer
Network layer	Network layer	Internet layer
Data link layer	Data link layer	
physical layer	physical layer	Network access layer

OSI → open system Interconnection 7 layer

ISO → International standards for organization 1947

OSI model

- ① Application:- Network Application
- HTTP / HTTPS / FTP / NFS / NNTP
- File transfer → FTP
- Web surfing → HTTP/s
- Emails → SMTP
- Virtual terminal → Telnet.

- ② Presentation layer:- received data from Application
- Translation | Data compression | Encryption → SSL
- secure sockets Layer

- ③ Session layer: connection sender and receiver
- ⑤ Authentication & ④ session management
- ⑥ Authorization

- ④ Transport layer:

① segmentation of Data are divided into small part

like

seq. numbr	port numbr
Data	unit

Flow control:

① Error control

there are two protocols are transport layer
services Protocol

Connection-oriented Transmission → (TCP) → Transmission control Protocol
→ connection less Trans... ↔ (UDP) → User Datagram Protocol (UDP)

Network layer: Transport layer are the sent data
in network layer.

① logical addressing

IPv4 and IPv6

↑
(mask)

→ called frame

② path determination

OSPF

BGP

IS-IS

Data link layer: Received package from Network layer

① Logical addressing

→ Network layer

② physical addressing

→ Data link layer

→ Access the media → control how data is placed and received from the media
Framing
(media Access control)
(Error detection)

→ physical layer:

Dynamic IP → Dynamic IP addresses → Automatically assigned by the server

Static IP Address: manually assigned and do not change.
